	Index	21

A non-hardware dependant miniature QR generator library. All native Python!

CHAPTER 1

Dependencies

This driver depends on:

- Adafruit CircuitPython

Please ensure all dependencies are available on the CircuitPython filesystem. This is easily achieved by downloading the Adafruit library and driver bundle.

CHAPTER 2

Installing from PyPI

On supported GNU/Linux systems like the Raspberry Pi, you can install the driver locally [from PyPI](#). To install for current user:

```
pip3 install adafruit-circuitpython-miniqqr
```

To install system-wide (this may be required in some cases):

```
sudo pip3 install adafruit-circuitpython-miniqqr
```

To install in a virtual environment in your current project:

```
mkdir project-name && cd project-name  
python3 -m venv .env  
source .env/bin/activate  
pip3 install adafruit-circuitpython-miniqqr
```

CHAPTER 3

Usage Example

```
import adafruit_minimqr  
  
qr = adafruit_minimqr.QRCode()  
qr.add_data(b'https://www.adafruit.com')  
qr.make()  
print(qr.matrix)
```

CHAPTER 4

Contributing

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

CHAPTER 5

Documentation

For information on building library documentation, please check out [this guide](#).

CHAPTER 6

Table of Contents

6.1 Simple test

Ensure your device works with this simple test.

7 # For drawing filled rectangles to the console:
8 out = sys.stdout
9 WHITE = "\x1b[1;47m \x1b[40m"
10 BLACK = " "
11
12
13 def prettyprint_QR(matrix):
14     # white 4-pixel border at top
15     for _ in range(4):
16         for _ in range(matrix.width + 8):
17             out.write(WHITE)
18             print()
19     for y in range(matrix.height):
20         out.write(WHITE * 4)    # 4-pixel border to left
21         for x in range(matrix.width):
22             if matrix[x, y]:
23                 out.write(BLACK)
24             else:
25                 out.write(WHITE)
26         out.write(WHITE * 4)    # 4-pixel bporder to right
27         print()
```

(continues on next page)

(continued from previous page)

```
28 # white 4-pixel border at bottom
29 for _ in range(4):
30     for _ in range(matrix.width + 8):
31         out.write(WHITE)
32     print()
33
34
35 qr = adafruit_miniqu.QRCode(qr_type=3, error_correct=adafruit_miniqu.L)
36 qr.add_data(b"https://www.adafruit.com")
37 qr.make()
38 print(qr.matrix)
39 prettyprint_QR(qr.matrix)
```

6.2 adafruit_miniqu

A non-hardware dependant miniature QR generator library. All native Python!

- Author(s): ladyada

6.2.1 Implementation Notes

Hardware:

- Any!

Software and Dependencies:

- Python 3

```
class adafruit_miniqu.QRBitBuffer
    Storage class for a length of individual bits

    get(index)
        The bit value at a location

    get_length_bits()
        Size of bit buffer

    put(num, length)
        Add a number of bits from a single integer value

    put_bit(bit)
        Insert one bit at the end of the bit buffer

class adafruit_miniqu.QRBitMatrix(width, height)
    A bit-packed storage class for matrices

class adafruit_miniqu.QRCode(*, qr_type=None, error_correct=1)
    The generator class for QR code matrices

    add_data(data)
        Add more data to the QR code, must be bytestring stype

    make(*, test=False, mask_pattern=0)
        Perform the actual generation of the QR matrix. To keep things small and speedy we don't generate all 8
        mask patterns and pick the best. Instead, please pass in a desired mask_pattern, the default mask is 0.
```

```
class adafruit_miniqur.QRPolynomial (num, shift)
    Structure for creating and manipulating error code polynomials

    get (index)
        The exponent at the index location

    get_length ()
        Length of the poly

    multiply (e)
        Multiply two polynomials, returns a new one

class adafruit_miniqur.QRUtil
    A selection of bit manipulation tools for QR generation and BCH encoding

    static get_BCH_digit (data)
        Count digits in data

    static get_BCH_type_info (data)
        Encode with G15 BCH mask

    static get_BCH_type_number (data)
        Encode with G18 BCH mask

    static get_error_correct_polynomial (ecc_length)
        Generate a ecc polynomial

    static get_mask (mask, i, j)
        Perform matching calculation on two vals for given pattern mask

    static get_pattern_position (qr_type)
        The mask pattern position array for this QR type
```

CHAPTER 7

Indices and tables

- genindex
- modindex
- search
